1. Introduction

1.1. Background to the survey

Preventing and combating violence against women is a **core area of the OSCE's work in promoting gender equality**. The participating States have adopted three Ministerial Council decisions on preventing and combating violence against women, including most recently in December 2018 in Milan. The OSCE Action Plan for the Promotion of Gender Equality from 2004 and other decisions also refer to combating violence against women. The OSCE recognizes the importance of combating violence against women to achieve comprehensive security and fulfil the UN's Sustainable Development Goals. At the same time, gender-based violence is one of the most pervasive impediments to women's full, equal and effective participation in political, economic and public life.¹

OSCE Ministerial Council Decisions on preventing and combating violence against women

- MC.DEC 14/04: Action Plan for the Promotion of Gender Equality
 - *Identifies combating violence against women as a priority area of work for the OSCE*
- MC.DEC 15/05: Preventing and combating violence against women
 - *Recognizes violence as a threat to human security and urges participating States to provide full access to justice, medical and social assistance, confidential counselling and shelter. It also calls on participating States to criminalize gender-based violence and highlights the importance of prevention.*
- MC.DEC 7/14: Preventing and combating violence against women
 - *Calls for action on legal frameworks, prevention, protection, prosecution and partnerships. It addresses the area of reliable data collection and calls on participating States to speed up efforts to bring legislation into line with relevant international standards, including the Istanbul Convention.*
- MC.DEC 4/18: Preventing and combating violence against women
 - *Recognizes that inequality is a root cause of violence against women and calls for measures to address this, including by engaging men and boys in combating violence. It also notes that special measures should be taken to address specific forms of violence such as sexual harassment and online violence.*

Although violence against women and girls (VAWG) has been recognized as important and efforts have been made to determine its scale and nature through international or, more frequently, national surveys, the results were never comparable on a regional scale due to the use of different definitions and methodologies. Of the OSCE's participating States, Serbia and Montenegro were part of the World Health Organization's (WHO) Multi-Country

¹ See "Decision 4/18: Preventing and Combating Violence against Women", OSCE Ministerial Council, 7 December 2018, accessed 21 July 2019, <https://www.osce.org/chairmanship/406019>.

Study on Women's Health and Domestic Violence against Women in 2003.² Another international survey, the Demographic and Health Survey, which contained a module on domestic violence, was conducted only in Albania (2008–2009 and 2017–2018), Moldova (2005) and Ukraine (2007). UNICEF's Multiple Indicator Cluster Surveys (MICS) were conducted in the regions covered by the OSCE-led survey on at least one occasion³, but these surveys focus not on VAW but rather on childhood violence, and they usually contain only a few questions concerning attitudes to intimate partner violence (IPV). Albania, Moldova, Serbia and Ukraine were part of the WHO's global status report on violence prevention 2014, but that was not a prevalence survey.

The OSCE-led survey is, therefore, a significant breakthrough in addressing violence against women in the area covered by the survey, as it provides robust, comparable and comprehensive evidence of VAWG within and beyond intimate partner relations and the domestic context. The survey results will enable exchanges of experiences, shared initiatives and joint policy actions that will facilitate the development of more effective systems for preventing violence and protecting women, particularly in the framework of implementation of the Istanbul Convention and the Convention on the Elimination of All Forms of Discrimination against Women.

Responding to the need for comparable data

There is a need to collect and learn from good practices within the area covered by the survey, as well as within the entire OSCE region. With its comparable data, the OSCE-led survey makes it possible to examine the situation in participating States and at the regional level. It also makes it possible to take a closer look at the reporting of violence and the reasons why women choose not to report abuse to the police or other services. This comparable data will enable regional initiatives and actions.

This research is based on the methodology used by the European Union Agency for Fundamental Rights (FRA) for its 2012 survey on violence against women in 28 European Union member states.⁴ This OSCE-led survey is therefore comparable to the FRA survey. The OSCE added to the survey several questions on norms, attitudes and behaviour related to violence and reporting experiences of abuse, in particular to ensure comparability of its data with the EU data on gender attitudes and norms (Eurobarometer No. 449). The European Institute for Gender Equality uses the FRA data in its current work and plans to use the findings of the OSCE-led survey in the future. The data also provides a regional baseline for two SDG indicators (5.2.1 and 5.2.2).

Data to inform and support policy-making and implementation

The aim of this survey is to provide robust data in order to develop more comprehensive and evidence-based policies, strategies, programmes and activities to prevent and combat VAWG. The ultimate goal is therefore to provide evidence for informed decision-making and advocacy at different levels, and thereby contribute to a reduction of VAWG in the target area, improved services for survivors and greater security for women. This is also key for achieving the goals of the UN's 2030 Agenda for Sustainable Development.

The survey provides data that is of direct policy relevance, as the prevalence of VAWG was determined for the 12-month period prior to the survey. Thus, data on reporting and official responses to victims, as well as current prevalence, is available for policy-making.

The survey is the first comparable regional survey ever conducted that captures the prevalence of violence against women and girls in the target area.

³ MICS 2 and 3 were conducted in Albania; MICS 2, 3 and 4 in Bosnia and Herzegovina; MICS 5 in Kosovo; MICS 2 and 4 in Moldova; MICS 2, 3, 5 and 6 in Montenegro; MICS 3 and 4 in North Macedonia; MICS 2, 3, 4 and 5 in Serbia; and MICS 2, 3 and 4 in Ukraine. See "Surveys", UNICEF MICS, accessed 21 July 2019, <http://mics.unicef.org/surveys>.

⁴ For more about the FRA survey and methodology, see *Violence against women: an EU-wide survey. Main results* (Vienna: European Union Agency for Fundamental Rights, 2015), accessed 21 July 2019, <http://fra.europa.eu/en/publication/2014/violence-against-women-eu-wide-survey-main-results-report>.

1.2. Overview of the study

The OSCE-led survey included:

- 114 key expert interviews from the area covered by the survey, providing an overview of issues related to VAWG and of conflict-related acts of violence targeting women;
- a survey of a representative sample of 15,179 women aged 18–74 living in Albania, Bosnia and Herzegovina, Montenegro, North Macedonia, Serbia, Moldova⁵ and Ukraine⁶ in order to establish the prevalence and consequences of violence by using a multistage, stratified, random probability sample design. The sample also included women living in Kosovo;⁷
- 63 focus groups with women from various demographic backgrounds on their attitudes towards the subject;
- 35 in-depth interviews with women who had experienced violence, including women with a disability, to understand, in more detail, the impact this had on them.

Overview of the quantitative survey

In total, 15,179 women aged 18–74 were interviewed face-to-face using a multistage, random probability approach. The data is weighted to the known population profile within each OSCE participating State. The data is also weighted to the known population profile in Kosovo. An additional weight (population weight) was calculated to enable reporting for the entire sample of the selected OSCE participating States or for a subgroup thereof.⁸ This weight reflects the distribution of the survey population across the area covered. Interviews were conducted by female interviewers who received training on the implementation of the survey.

The main goals of the study are to provide evidence of the prevalence of violence against women and girls and its consequences on women’s health and well-being for the purposes of policy-making. The main research questions were:

- What are the attitudes and norms concerning gender roles and violence against women?
- What is the extent of violence experienced by women in the area covered by the survey?
- Which forms of violence do women experience?
- Who are the perpetrators of violence against women?
- What are the consequences of violence for women’s health and well-being?
- Do women report their experiences to the police or other authorities or organizations? If not, why not?
- Are there differences between women’s experiences of violence depending on their age, education, professional status, income or whether they are from a minority group or a rural area?

The study also aimed to achieve a better understanding of the above in light of whether women had experienced an armed conflict based on the definitions used in the study.

Overview of the qualitative research

The qualitative part of the research consisted of three different activities.

⁵ While the survey was not conducted in Transnistria, focus group discussions were conducted with women from the region. “Moldova” is used to refer to the “Republic of Moldova” throughout the report.

⁶ The sample in Ukraine does not cover the Autonomous Republic of Crimea or non-government-controlled areas in the Donetsk and Luhansk regions. The survey was carried out on a sample representative of the adult population of women (2,048 women aged 18–74), including 298 women living close to the contact line in the Donetsk and Luhansk regions, in an effort to better understand how conflict affects violence against women.

⁷ All references to Kosovo, whether to the territory, institutions or population, in this text should be understood in full compliance with United Nations Security Council Resolution 1244.

⁸ The same was done for Kosovo.

First, 114 key experts shared their views on the current state of how governmental institutions and NGOs are working to prevent VAWG, what support is available to women who have experienced VAWG, and what improvements they recommend. These experts included representatives of international organizations as well as governmental and non-governmental institutions.

Second, a total of 63 focus group discussions were conducted with women from different age groups, women living in urban and rural areas, women from different minority backgrounds and women who had experienced conflict. The aims of these discussions were:

- To understand societal attitudes towards women generally and to understand VAWG and the perpetrators of such violence;
- To explore how attitudes towards, and experiences of, VAWG have changed over time, including in periods of conflict;
- To explore the degree to which women are aware of existing support measures, their views on those measures and any barriers that might prevent them from accessing support; and
- To identify how prevention and support could be improved.

Finally, 35 in-depth interviews were conducted with survivors of violence, including women with a disability. The aims of these interviews were:

- To explore the forms of violence that women have experienced throughout their lifetime and the impact of conflict;
- To identify barriers to disclosing experiences and to seeking support, and to explore reasons why some women choose to disclose their experiences and others do not;
- To understand the support received, to identify gaps in service provision and to identify the unmet needs of women from specific minority groups (e.g., women from an ethnic minority or with a disability); and
- For women who have gained access to support (formal or informal), to understand how they were able to access such support and the impact this had on them.

All the qualitative research was conducted by experienced female interviewers and moderators.

1.3. Project management

The OSCE commissioned Ipsos to undertake the co-ordination and management of the study. The Central Co-ordination Team (CCT) at Ipsos took the lead in liaising with all local partner agencies and in carrying out quality control to ensure that the study was delivered with maximum consistency and to the highest quality standards across the seven participating States. The CCT also co-ordinated the work in Kosovo.

Ipsos partnered with the International Center for Research on Women (ICRW) based in Washington, DC, for the initial design of the qualitative research, input into the questionnaire and training of the local project managers.

The project was managed at the OSCE by Serani Siegel and Dušica Đukić, with support from Gergely Hideg (independent statistical expert).

Local research teams

The local fieldwork partners were fundamental to collecting robust, comparable data in all the participating States and in Kosovo. The table below lists the local agencies responsible for fieldwork delivery.

Table 1.1. Fieldwork agencies responsible for data collection and qualitative fieldwork in OSCE participating States

Agency	
Albania	Ipsos Albania
Bosnia and Herzegovina	Ipsos Bosnia and Herzegovina
Montenegro	Ipsos Montenegro
North Macedonia	Ipsos Macedonia
Serbia	Ipsos Serbia
Moldova	IMAS
Ukraine	Ipsos Ukraine

Agency	
Kosovo	Ipsos Kosovo

1.4. Ethical and safety considerations

Given the sensitivity of the survey, a number of steps were taken to protect both respondents and interviewers from potential harm and to provide sources of support in the event of distress:

- All interviewers and moderators were women who had experience conducting surveys on sensitive issues and who were native speakers of the language used for the interviews. All interviewers and moderators attended a two-day briefing.
- For the protection of both respondents and interviewers, interviewers were instructed not to disclose in advance that the survey was about violence, and to conduct the survey in private.
- At the end of the survey, focus group discussions and in-depth interviews, all respondents were offered information on support organizations that they could contact should they wish to discuss any issues arising as a result of taking part in the survey.
- The project co-ordinator was available for interviewers and moderators to speak with at any time during fieldwork, and individual meetings with counsellors could be arranged if needed.
- Adherence to ethical principles is a cornerstone of the research methodology used for the OSCE-led survey, and the procedures used by the World Health Organization⁹ and the United Nations *Guidelines for Producing Statistics on Violence against Women*¹⁰ were taken into account.

1.5. Report structure

This report presents a detailed overview of the research methods used for collecting the quantitative and qualitative data on women's personal experiences of various forms of violence and the interviews conducted with key experts. Chapter 2 provides details on the development and translation of the questionnaire and other survey materials, and Chapter 3 covers the local field staff and the training of interviewers and moderators. Chapter 4 provides details on the sample frames and sampling methodology. Chapter 5 summarizes the quantitative pilot study. Chapters 6 and 7 provide details on the quantitative and qualitative fieldwork, and Chapter 8 details the weighting that was implemented.

2.

Development and translation of the quantitative research materials

The OSCE-led survey on violence against women was implemented via face-to-face interviews using computer-assisted personal interviewing (CAPI). A self-completion section was administered either via CAPI or, if preferred by the respondent, on paper. In addition to the CAPI questionnaire and self-completion questionnaires, the other materials used for the implementation of the survey were:

- **Electronic contact sheets** for screening respondents and monitoring fieldwork, administered via CAPI;
- **Showcards** for interviewers and respondents to facilitate and standardize response selection during the interview;
- A **letter** to help interviewers introduce the survey to potential respondents;
- A **list of support organizations** that provide help to women who have experienced violence; this list was offered to all respondents at the end of the survey;
- A **training manual** issued to all interviewers.

The development and translation of all materials are discussed in more detail below. The full list of materials and languages that were used is provided later in this section in Table 2.2.

2.1. Questionnaire development

The OSCE-led survey used as a source the questionnaire implemented by the FRA in its survey on violence against women conducted across the European Union in 2012. Given that one of the objectives of the OSCE-led survey was to understand the impact of armed conflict on women's experiences of violence, the questionnaire was expanded with additional modules that went through several rounds of consultation and testing to ensure that the new questions added were suitable and that the questionnaire would work in the regions covered by the OSCE-led survey.

The OSCE developed the initial additional questions to capture whether respondents were conflict-affected and their experiences related to conflict in collaboration with OSCE gender focal points and gender experts from OSCE field operations covered by the survey and the OSCE Special Monitoring Mission to Ukraine and with additional international experts from the Small Arms Survey¹¹, the World Bank, the United Nations Population Fund (UNFPA), an expert from the International Criminal Court and a researcher with experience conducting surveys in conflict-affected areas. Gergely Hideg, a statistical expert hired by the OSCE, was also involved in the development of the questionnaire.

Expert consultation

The full questionnaire was reviewed by a group of experts with expertise on violence against women. The experts consulted included OSCE gender focal points and gender experts from OSCE field operations and the OSCE Special Monitoring Mission to Ukraine, the Agency for Gender Equality of Bosnia and Herzegovina, Elizabeth Rowley from Path, the European Union Agency for Fundamental Rights, the Kosovo Women's Network, Manuel Contreras-Urbina of George Washington University, Nino Javakhishvili of Ilia State University, the United Nations in Bosnia and Herzegovina and the United Nations Population Fund.

¹¹ For more information, see the website of the Small Arms Survey at <http://www.smallarmssurvey.org>.

The experts were asked to review and comment on the conflict-specific questions in particular. They were asked to consider whether the questions elicited the desired information, whether the respondents would understand them as intended and whether they could be easily read aloud in respondents' homes. Feedback was collected in writing and via telephone.

A number of suggestions were made to improve the phrasing of questions to avoid misunderstandings. For instance, some experts expressed the opinion that asking women about the conflicts they had "lived through" could be confusing, so this was changed to conflicts they had "experienced". It was also suggested that more options be included, e.g., including post-traumatic stress disorder in the list of potential impacts experienced by partners who had fought in a conflict.

Experts were asked what measures should be put in place to encourage disclosure. Views were sought on whether presenting a short case study to respondents would help increase disclosure of current partner violence and what potential impact this would have on comparability with the FRA's EU-wide survey on violence against women. While some experts thought a case study could help with disclosure, others felt that it could be misleading or confusing. It was decided not to include case studies in the questionnaire.

Experts were also asked for suggestions on questions that could be included to measure attitudes towards violence against women, reporting violence against women, intervention on the part of family members or others and gender equality. This attitudinal data was required to assist in the analysis of the findings. A number of suggestions were made in relation to this. The use of questions from previous surveys, such as the European Commission Special Eurobarometer No. 449 on gender-based violence, was also recommended.

Cognitive testing

Following the revisions made to the questionnaire in light of the expert consultation, a subset of the questions were cognitively tested in May and June 2017. The objectives of the cognitive testing were:

- To test the feasibility of survey questions related to conflict among respondents from the target groups;
- To test the suitability of the questions related to attitudes and norms in the regions to be covered by the OSCE survey;
- To further develop and improve the OSCE survey questionnaire by ensuring that new questions were comprehensible, acceptable and internationally comparable.

Bosnia and Herzegovina, Serbia and Ukraine were selected for the cognitive interviews, as it was agreed that these were the most relevant for testing the conflict-related questions. Cognitive interviews were also conducted in Kosovo.

Initially, 19 cognitive interviews were conducted in each of Bosnia and Herzegovina, Serbia and Ukraine. Nineteen cognitive interviews were also conducted in Kosovo. Respondents were selected so as to offer sufficient diversity in terms of age, education level, experiences of conflict and experiences of violence. Recruitment also sought a balance in terms of the employment and relationship status of each respondent. Following feedback from these interviews, four more interviews were conducted (two in Bosnia and Herzegovina and two in Serbia) to test an alternative questionnaire structure.

Given that the target group and majority of the interviews consisted of conflict-affected women, the OSCE provided Ipsos with contacts from local NGOs and support groups that provided support for such women to help with the recruitment. This was supplemented by free-find recruitment by the local fieldwork agencies for interviews with women who had not experienced violence (or where the NGOs could not secure enough participants).

The questions selected for cognitive testing related to experiences of conflict; experiences of harassment; psychological, physical and sexual violence at the hands of partners (current

and previous) and non-partners; experiences of violence during a conflict; and attitudes towards violence against women and disclosure. In addition, some other questions were included for filtering purposes (e.g., relationship status, most serious incident), but these were not cognitively tested.

All questions that were cognitively tested were translated and proofread by the local Ipsos offices. These translations were reviewed by the OSCE before testing.

All interviews were carried out by researchers (rather than field interviewers) from each local agency who were briefed by Ipsos's Central Co-ordination Team on issues related to violence against women, the questions to be tested and cognitive interviewing techniques. All interviews were conducted in private locations, either at the offices of the local NGOs that assisted with recruitment or the local research agencies.

For the most part, the questions tested were not found to be problematic. Questions that explored the extent of violence that occurred during, or that was connected with, conflict worked well, and in most cases respondents were clearly able to determine whether an incident was connected with a conflict or not. There were a few instances that, by their very nature, were less clear-cut, e.g., when violence was perpetrated by a partner, and the respondent was not sure if her partner's behaviour was due to his experience of a conflict.

In the majority of interviews, the moderators thought that respondents were being open and honest about their experiences throughout the interview. However, it should be borne in mind that many of the respondents were recruited through support agencies and so may have been more open to discussing their experiences than the general population.

It was found that the interviews lasted longer than anticipated and that respondents became tired or distracted towards the end of the interviews. While the nature of the cognitive interviews meant that there was a lot of probing and open questions that impacted the interview length, this highlighted the need to reduce the length of the main questionnaire to reduce the burden on the respondent, to ensure data quality and to complete the fieldwork within the allocated budget. As a result, a number of questions were deleted following testing.

During the interview, several respondents were reported to have become upset or distressed when discussing their experiences, particularly in relation to questions directly related to conflict. There were concerns about the repetitive nature of the questionnaire structure causing distress, as women were asked about their experiences of violence in general and then whether the most serious incident they identified was connected to conflict, followed later by further questions about violence during conflict specifically. In some cases, the moderators chose not to continue with this final set of questions, as they felt that this was retraumatizing respondents.

Due to these concerns, four further cognitive interviews were conducted (two in Bosnia and Herzegovina and two in Serbia) with a different questionnaire structure. The questions about experiences of violence during conflict were asked earlier in the questionnaire. This meant that rather than being in a separate section on conflict, they were asked in the relevant section on violence (e.g., sexual harassment, non-partner violence). The moderators conducting these interviews reported that this revised structure flowed better and appeared to cause less distress. This revised structure was used in the pilot stage.

Changes were also made to the wording of the questionnaire to improve clarity. For instance, the question about experiences of active conflict was confusing for some respondents, who understood conflict as an argument between individuals rather than an armed conflict. The term "active conflict" was therefore changed to "active armed conflict" to avoid confusion. In other instances, further explanatory wording was added. For example, in a question asking whether a woman would tell someone about violence she experienced even if it was not very severe, a definition of "not very severe" was added (see QAN6 in Annex 4.).

Pilot study

The feedback from the cognitive interviews was incorporated into the questionnaire, which was then fully translated (as described in Section 2.3) into all target languages. A pilot study was then conducted in November and December in the seven OSCE participating States. The pilot study was also conducted in Kosovo.

The purpose of the pilot study was to test all aspects of the survey design, including the questionnaire. This pilot study is discussed in Chapter 5.

Final questionnaire

The final questionnaire consisted of 16 sections and was structured as follows:

Table 2.1. Structure of the questionnaire

Section	Overview
Section A: Introduction	The introductory section included questions about the respondent's background (e.g., age, occupational status, marital status, etc.), which were necessary to obtain general information and to apply the correct filters through the remainder of the questionnaire.
Section AN: Attitudes and norms	The questions in this section measured attitudes towards different types of violence and gender roles.
Section AA: Conflict experience	Section AA established whether the respondent had experienced armed conflict in her lifetime. A list of the most relevant conflicts and an option to provide details of any others were provided.
Section B: Health, feelings of safety, knowledge about services	This section included questions on the respondent's health, how safe they felt in various situations and their awareness of various organizations that provide support to women who have experienced violence.
Section C: Sexual harassment	This section recorded the respondent's experiences of various forms of sexual harassment by anyone they knew or by strangers.
Section D: Experiences of physical and sexual violence at the hands of someone other than the respondent's current or previous partners	This section asked about experiences of various forms of physical and sexual violence at the hands of people other than the respondent's current or previous partners.
Section F: Experiences of physical and sexual violence at the hands of the respondent's current partner	All women who were in a relationship at the time of the survey (whether they were living with the person or not, including boyfriends or girlfriends) were asked the questions in this section. Respondents were asked about their experiences of various forms of psychological, physical and sexual violence at the hands of their current partner.
Section G: Current partner background	This section recorded background and demographic details about the respondent's current partner, including whether they had ever fought in an armed conflict.

Section	Overview
Section H: Experiences of physical and sexual violence at the hands of the respondent's previous partner(s)	All women who had been in a relationship in the past (whether they lived with their partner or not, including boyfriends or girlfriends) were asked the questions in this section. The questions referred to any past relationship at any age (including those before the age of 15 if the respondent wanted to include them). Respondents were asked about their experiences of various forms of psychological, physical and sexual violence at the hands of their previous partner(s).
Section I: Repeated incidents (stalking)	This section dealt with respondents' experiences of stalking or repeated incidents such as receiving unwelcome phone calls or being followed, or other types of unwanted persistent or repetitive behaviour (such as receiving unwelcome text messages, emails, letters or photos, or having unwanted personal comments posted on the Internet).
Section J: Experiences in childhood	Section J dealt with respondents' experiences of violence during their childhood perpetrated by adults 18 or older (whether family members or other adults).
Section CO: Violence in conflict	Women who were defined as conflict-affected according to their answers in Section AA were asked the questions in this section. They were asked about the different experiences that someone can have due to a conflict.
Section K: Respondent background	This section recorded further socio-demographic details about the respondents. It also included two questions on whether respondents had been threatened or attacked with a firearm.
Section L: Attitudes and behaviours/conclusion	This section contained more questions on attitudes about violence, perceptions of how common violence against women is, how well informed women feel about what to do if they experience violence and if they had seen any communications regarding violence against women.
Section M: Self-completion form	This section included questions on whether women had experienced intimate partner, non-partner or childhood violence; these questions were completed independently by the respondents via the CAPI device or on a paper form (as decided by the respondent) rather than administered by the interviewer.
Section IA: Interviewer feedback	The final section included questions for the interviewer to provide their evaluation of the interview.

For conflict-affected women, Sections C, D, F, H, I and J included questions on whether any incident and specifically the most severe incident of violence experienced were connected to an armed conflict the respondent had lived through.

Questions regarding the respondent's highest level of education and that of their current partner and questions on awareness of organizations that provide support to women who have experienced violence were localized for each location to match the specific contexts. Details can be found in Annex 1.

2.2. Survey materials

Electronic contact sheet

A contact sheet was used to screen for eligible households and select respondents. This was scripted on the CAPI device. The contact sheet contained the introduction to the survey, established whether the selected addresses were eligible (i.e., whether they were residential and included one or more women aged 18–74) and aided the randomized selection of respondents where there was more than one eligible respondent in the same household. It also contained a record of all visits to each selected address, the outcome of the visit and if a household refused to take part, the reasons for doing so.

Showcards

Showcards were used to show respondents lists of responses to certain questions that they could choose from. Showcards allowed respondents to read through the response option categories at their own pace, more than once if necessary, so that they were able to evaluate and consider all options adequately. Showcards were based on the approved questionnaire translations.

Introductory letter

An introductory letter was used to introduce the survey to potential respondents. It provided details about the survey sponsor (the OSCE), the survey and the local fieldwork agency. The letter said the survey was about the well-being and safety of women to ensure that other members of the respondent's household would not know that the survey asked women about their experiences of violence.

List of support organizations

A short list of organizations that provide assistance to women who have experienced violence was offered to all respondents at the end of the survey, regardless of whether they disclosed experiences of violence during the interview or not. The list was provided on a business card so that it could be stored discreetly. The lists of support organizations offered to respondents at each location are provided in Annex 2 and were agreed in collaboration with the local fieldwork agencies, the OSCE and the OSCE missions in the area where the survey was conducted.

Interviewer training manual

An interviewer training manual was developed for all interviewers for use during the training and the fieldwork. The content of the interviewer training manual closely followed the content of the face-to-face briefing sessions, as discussed in Chapter 3, providing details on:

- The background and objectives of the survey;
- Definitions and consequences of violence against women;
- Ethical and safety considerations when conducting research on violence against women;
- Sampling and contact procedures;
- An overview of the questionnaire and question-specific instructions;
- General interviewing techniques and guidelines.

2.3. Translation of the questionnaire and survey materials

All interviewer and respondent-facing materials were translated into the relevant languages as specified in Tables 2.2 and 2.3 below.

Table 2.2. Language of interviews used in the OSCE participating States

Language	
Albania	Albanian
Bosnia and Herzegovina	Bosnian
Montenegro	Montenegrin
North Macedonia	Macedonian, Albanian
Serbia	Serbian
Moldova	Romanian, Russian
Ukraine	Russian, Ukrainian

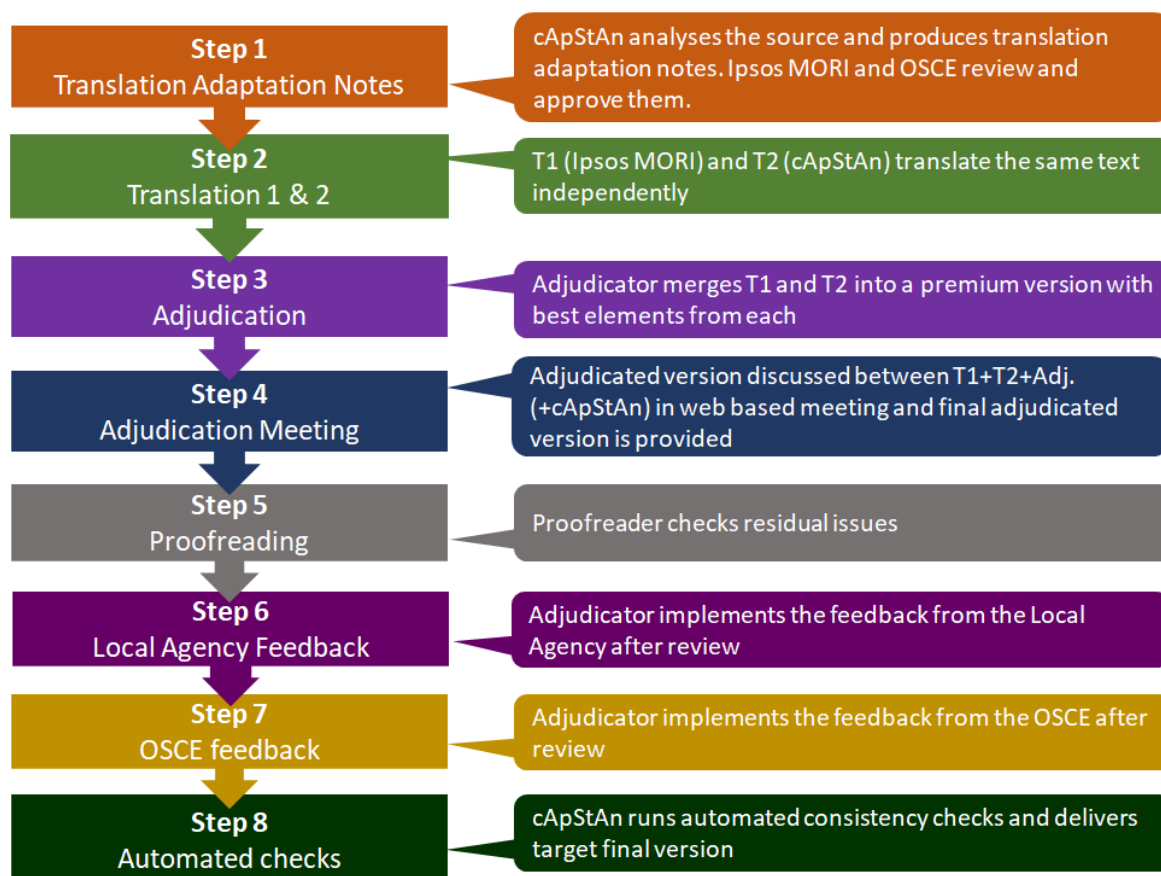

Table 2.3. Language used for interviews in Kosovo

Language	
Kosovo	Albanian, Serbian

Questionnaire translation

The approach adopted for the translation of the questionnaire included the main features of the TRAPD (translation, review, adjudication, pre-test and documentation) model, as illustrated in the figure below and described in detail in the rest of this section.

Figure 2.1. Overview of the translation process

Ipsos translated the questionnaire in collaboration with cApStAn (and its sister translation agency, BranTra), a specialist translation agency Ipsos has worked with in the past.

For the Bosnian and Serbian versions of the questionnaire, the Croatian questionnaire used for the FRA’s survey on violence against women was used as the basis for the adaptation of questions that had already been translated. Any new parts added to the translation followed the same approach as for the full translation. The same was done for Moldova and Ukraine, where the existing translations in Romanian and Russian from the FRA survey were used as a starting point.

Each team of translators consisted of two translators, who each produced an original translation of the source questionnaire (Translation 1 and Translation 2), and an adjudicator responsible for merging and adjudicating the two translations. Translator 1 (T1) and the adjudicator were appointed by cApStAn, while Translator 2 (T2) was appointed by the local fieldwork agency. For adapted versions of the translations (where languages are shared), an adaptor was also appointed by cApStAn.

Step 1: Translation and adaptation notes

Item-specific translation and adaptation notes were agreed with the OSCE, cApStAn and Ipsos in the initial stage of preparing the source questionnaire. These included clear instructions about national adaptations that were necessary, desirable or ruled out; information about the target group; and clarifications about the way certain terms or phrases should be understood, so that the translators were guided in their work without having to go back and forth between several reference documents.

Prior to starting any translation, a web-based training seminar was organized by BranTra/cApStAn for both the translators and the adjudicators/adaptors. Participation in the webinar was a prerequisite for participation in the project. BranTra/cApStAn talked through

the localization design with the webinar participants and explained the workflow, drawing attention to survey-specific aspects and conventions.

Step 2: Double translation

Two original translations were produced. As a general rule, T2 translated the entire text, while T1 translated only segments marked for double translation (i.e., segments that were considered to be more sensitive or complex).

Step 3: Adjudication

The two translations were collated by cApStAn and shared with the adjudicator, whose task was to provide a reconciled version ensuring consistency in terminology used throughout the questionnaire. The adjudicator logged any comments, challenges involved in making choices, residual doubts or adaptation issues for discussion during the team review meeting.

Step 4: Adjudication meeting

An adjudication meeting was held with the two translators, the adjudicator and a moderator from cApStAn.

The two original translations and the reconciled version were shared with both translators in advance of the team review meeting. The comments and challenges previously earmarked for discussion by the adjudicator were discussed during the meeting with a view to resolving any outstanding issues. Following the meeting, the adjudicator produced the final versions of each translation, taking into consideration the discussion at the adjudication meeting.

Shared-language versions

Some translations were shared across OSCE participating States, e.g., Albanian in Albania and North Macedonia. In these cases, the full translation process was followed to produce one version that was then subsequently adapted for use in each country to ensure that any local dialects or terms were incorporated. For these shared-language versions, the adaptors were also invited to the team review meeting. Their role was to contribute to the discussion, to point out differences for their adapted version and also to ensure that residual errors spotted by each adaptor would be corrected in all versions of that language, if applicable.

Step 5: Proofreading

The proofreader's role was to correct errors in the target language without reference to the source. During this step, a check for spelling, grammar, syntax and completeness was performed.

Step 6: Final checks

The proofread file was then prepared by cApStAn for final delivery. The final automated checks involved ensuring consistency in the translation of agreed key terms and ensuring that all segments of the questionnaire were translated.

The translation process was fully documented using a centralized monitoring tool reflecting each step of the process. This was provided to the OSCE.

Step 7: OSCE review

Following the steps outlined above, all translations were provided to the OSCE for final review and approval.

Step 8: Post-pilot changes to the questionnaire/translation

Any changes made to the source questionnaire were reflected in the translation. The translators appointed by the local fieldwork agencies were responsible for making the updates.

Translation of survey materials

A simplified translation approach was adopted for the translations of the other survey materials (contact sheet, introductory letter and interviewer training manual), involving single translation and proofreading by two separate translators. The showcards used the approved

questionnaire translations. The translated versions of the survey materials were provided to the OSCE for final approval.

3.

Training sessions and field staff

To ensure a common understanding of the research objectives and research methods, as well as the quality of the data collected, all local project managers, moderators and interviewers were required to attend training that was centrally developed by the OSCE in collaboration with Ipsos and the ICRW. This chapter provides details of the training. It also provides details of the fieldwork staff who collected the quantitative survey data.

3.1. Central project briefing

A four-day central briefing for all local project managers and moderators from the local research agencies responsible for implementation of the study in each of the seven OSCE participating states was held in Belgrade, Serbia, from 14 to 17 November 2017 (before the start of the pilot survey). Representatives from the local research agency in Kosovo also attended. The training session was delivered by representatives from the OSCE, UNFPA and ICRW teams; a representative of a Serbian NGO, the Centre for Support of Women; and members of Ipsos's Central Co-ordination Team.

The training agenda was as follows:

Day 1

- Introduction to the OSCE and the survey objectives (led by the OSCE)
- Definitions of violence against women and its consequences (led by the ICRW and the Centre for Support of Women)
- Violence in conflict (led by the UNFPA)
- Ethical considerations, including informed consent (led by the ICRW and the Centre for Support of Women)

Day 2

- Background, objectives and design of the qualitative research (led by Ipsos and the ICRW)
- Recruitment of participants for the focus group discussions and in-depth interviews (led by Ipsos)
- Using the topic guides and qualitative research techniques (led by Ipsos and the ICRW)
- Ensuring the well-being and safety of participants and moderators (led by Ipsos)

Day 3 (led by Ipsos)

- Overview of the quantitative survey
- Introducing the survey and informed consent
- General interviewing techniques and special considerations for conducting interviews on violence against women
- Ensuring the well-being and safety of respondents and interviewers
- Questionnaire overview
- Questionnaire practice
- Discussion on the practice interviews

Day 4 (led by Ipsos)

- Sampling overview and requirements
- Selection of households and respondents

- Completing the electronic contact sheets – overview and practice
- Quality control and monitoring fieldwork progress

The materials used during the central briefing session were provided to all local teams for use during the interviewer briefing sessions.

3.2. Interviewer selection and training

Due to the complexity and sensitivity of the survey, the interview panels in each of the seven OSCE participating States consisted only of women who were native speakers of the language selected for the interviews. The same requirements applied to Kosovo.

In addition to these requirements, the initial specifications required interviewers to have at least three months of active interviewing experience and experience conducting research using CAPI technology. However, after a number of interviewers dropped out and some interviewers referred by local NGOs were added to the fieldwork teams, interviewers who did not meet these requirements had to be employed in some participating States. The same applied in Kosovo. Interviewers without previous experience using CAPI software were trained in the use of this software, while interviewers with less than three months of interviewing experience were accompanied by fieldwork supervisors during the first days of the fieldwork.

Details on the number of interviewers who were trained and conducted interviews are provided in Tables 3.1 and 3.2 in this section.

All interviewers were required to attend a two-day briefing. The interviewer briefings followed a similar structure to the central briefing, and the project managers were instructed to tailor and translate the centrally produced materials for use in their briefings. They were advised to pay particular attention to interviewing techniques, sampling rules, completion of the contact sheet, the questionnaire and fieldwork logistics. The project managers were also advised to remind interviewers about the quality control measures and to share best practices, especially from those interviewers involved in the pilot. The local project managers were responsible for delivering the training to interviewers. Local NGOs that support women who have experienced violence also attended the training to provide further context on the issue of violence against women and its impact.

After the training, all interviewers conducted test interviews to familiarize themselves with the questionnaire and the overall flow of the data collection script.

The tables below include information about the briefings and the number of interviewers in each of the seven OSCE participating States and in Kosovo.

Table 3.1. Local briefings and the number of interviewers engaged in the OSCE participating States surveyed

	Total number of interviewers briefed	Briefing dates (all in 2018)	NGOs involved	Number of interviewers who completed at least one interview
Albania	40	20–21 March, 9–10 April, 26–27 April, 7–8 May	Gender Alliance for Development Centre	40
Bosnia and Herzegovina	96	17–18 March	Foundation of Local Democracy (Sarajevo)	81
North Macedonia	65	19–20 March, 14–15 April	National Network to End Violence against Women Domestic Violence “ <i>Voice Against Violence</i> ” National Council for Gender Equality	53
Montenegro	41	21–22 March, 14–15 May, 15–16 May	SOS Nikšić	41
Serbia	60	17–18 March, 19–20 March, 7–8 May	Centre for Support of Women Victimology Society of Serbia	60
Moldova	46	24–25 March, 4–5 July	La Strada	46
Ukraine	78	18–19 March, 1–6 April	Democracy Development Centre	77

Table 3.2. Local briefings and the number of interviewers engaged in Kosovo

	Total number of interviewers briefed	Briefing dates (all in 2018)	NGOs involved	Number of interviewers who completed at least one interview
Kosovo	84	Albanian-speaking: 16–17 March, 30 April and 3 May Serbian-speaking: 29–30 March, 6 June	Ruka Ruci Kosovo Women’s Network	63

The proportion of interviews that any one interviewer could complete was capped at 5% for quality control purposes. This was adhered to in all case except for one interviewer in Montenegro who completed 68 interviews, representing 5.5% of the sample.

The local project manager was available for interviewers to speak with at any time during the fieldwork, and individual meetings with counsellors could be arranged if needed. No interviewers requested any professional counselling following their involvement in the survey.

4. Sampling

This section describes the sample frames available for this survey across the seven OSCE participating States and provides a description of the sampling methodologies implemented. The same is provided for Kosovo. Two different approaches to selecting addresses were used: direct sampling of the addresses from the available address registers and a random walk approach where such registers are not accessible for the purposes of this research.

4.1. Sample frames

In the preparatory phase for the main survey, suitable sample frames that would make it possible to create representative random probability samples were sought in each of the OSCE participating States where the survey was conducted. The same was done in Kosovo. Ideally, registers that allow direct sampling of *individuals* (women aged 18–74) would be used in each. However, sample frames of this type are not available in an accessible manner in any of the seven OSCE participating States surveyed. An individual-level register is not available in Kosovo either.

In Montenegro and Serbia, address registers that enable direct sampling of *addresses* were identified. In the remaining five OSCE participating States, no sample frames that would allow direct sampling of individuals or addresses were available. In these, the smallest sampling units that could be preselected from existing lists were small territorial units, within which addresses could later be enumerated and sampled by interviewers. The same could be done in Kosovo.

The address registers available in Serbia and Montenegro enabled a direct approach to selecting addresses. Details of both registers can be seen below.

Table 4.1. Address registers in Montenegro and Serbia

	Name of the register	Register provider	Update	Coverage	Ineligible cases
Montenegro	Statistical register of addresses	Statistical Office of Montenegro	2011	100% at the time of the 2011 census. However, new addresses established or inhabited since 2011 are not covered.	Addresses that have become non-residential units, vacant or uninhabited since 2011
Serbia	Statistical register of addresses	Statistical Office of the Republic of Serbia	2011	99% at the time of the 2011 census. Areas in south Serbia with an Albanian majority (who did not participate in the latest census) are not covered. This population (not covered by the census) represents 1% of the total population. Additionally, new addresses established or inhabited since 2011 are not covered.	Addresses that have become non-residential units, vacant or uninhabited since 2011

However, both registers came with certain restrictions.

The address register available in Serbia originates from the 2011 census, and it makes it possible to identify all addresses in areas where street names and house numbering are officially specified. In certain villages and suburban areas of Serbia, houses do not have unique address identification, as they are not numbered, and street names also do not exist in most cases. Furthermore, addresses were listed in the frame seven years prior to the survey, meaning that any new addresses established or inhabited since 2011 are not included. At the same time, some addresses may have become uninhabited since 2011. Nevertheless, these changes were not expected to be extensive, so it was expected that a very small proportion of addresses would not be covered or would be ineligible.

Related to the timeliness of the register, the Statistical Office of the Republic of Serbia was contacted to explore the possibility of obtaining a sample of addresses from an updated list of addresses enumerated in the 2011 census. The Statistical Office confirmed that it contained the updated list with relevant changes since 2011. Hence, the local agency made a request to obtain all the addresses in the primary sampling units (PSUs) selected in the sample. Once the list was received, it was noticed that the update had been made only at the level of buildings, not at the level of individual addresses. The list did not separate individual apartments in multiple-apartment buildings, nor did it provide information on the number of apartments in the building. Furthermore, it did not contain information on whether these buildings were residential or not. Hence, this list was not regarded as an improvement on the 2011 register, as the latter contained more details that were useful for sampling addresses. The 2011 register was therefore used in its original version.

It was not possible to use the register to select addresses in areas where the address details available were not sufficient for the purposes of unique identification. These areas included certain villages and suburban areas of Serbia where houses are not numbered and where, in most cases, street names also do not exist. Since these areas represented 16% of the selected sample, it was decided to use the random walk approach to select addresses in them.

Similarly, the address register in Montenegro originates from the 2011 census, and it also does not provide updated information on changes since then. Additionally, villages and suburban areas of Montenegro are often affected by irregular settlement structures, hence the street-naming and house-numbering system is less developed. Around half of all addresses in Montenegro do not have unique address details. Furthermore, although the register makes it possible to identify addresses in areas where street names exist and buildings are uniquely numbered, and it does contain information on the total number of inhabited apartments in multiple-apartment buildings, it does not allow unique identification of apartments within these buildings. In these instances, the selection of apartments was performed randomly in the electronic contact sheets.

As it was not possible to use the register to select addresses in areas where the address details available were not sufficient for unique identification, it was decided that the random walk approach would be used to select addresses in these areas. Furthermore, as explained above, due to the limitations in the register, it was not possible to preselect separate dwelling units (apartments) in multiple-apartment buildings. However, as the number of inhabited dwelling units within each building was available, this ensured that all dwelling units in each PSU had the same chance of being selected in the sample. This meant that within one multiple-apartment building, more than one dwelling unit could have been assigned in the issued sample. The selection of actual apartments, however, needed to be done on the spot through the electronic contact sheets. This approach was successfully tested in the pilot and so adopted in the main survey. The interviewers were instructed to record in the electronic contact sheets any cases of multiple dwellings at the issued addresses. The sample frame information on the number of dwelling units expected at each selected address was imported into the electronic contact sheets. At every address where more than one dwelling unit was expected, this information was presented on the screen to the interviewers, and they were then prompted to count the number of units they could identify and to enter that information in the contact sheet. As the number of dwelling units selected at each address was predefined, the electronic contact sheet could then select the required numbers ranging from one to the total number of identified dwelling units. This range was used for the selection of a random number. Interviewers were then given precise instructions on how to identify the units (apartments) selected by the contact sheet.

For those OSCE participating States where registers that would enable direct sampling of addresses are not accessible for research purposes, it is essential that information on population numbers for small territorial units be available. The geographical boundaries of these units need to be clearly defined, unambiguously separating one unit from another, and the population numbers should ideally be updated regularly. These conditions were satisfied, and exhaustive national lists of suitable sampling units were eventually available in all the OSCE participating States where the survey was conducted. The same was available in Kosovo.

In Bosnia and Herzegovina, obtaining the list of census enumeration areas and statistical sectors with their population numbers, and consequently the maps of selected areas, took several weeks, which caused a delay in the start of fieldwork.

In Montenegro and Serbia, where census address registers were used, census enumeration areas and statistical sectors were considered as possible options for PSUs. The same areas were considered in Bosnia and Herzegovina, as the data on population size at the level of these units was available. However, neither of them fully satisfied the requirements for ideal PSUs. The census enumeration areas were often quite small, so they did not allow enough addresses to be selected to achieve the target number of interviews per PSU, while in statistical sectors the population sizes ranged from very small to very large numbers. Eventually, in Bosnia and Herzegovina, Montenegro and Serbia statistical sectors were not

used directly, but units derived from these by merging, where necessary, several neighbouring census enumeration areas into one new unit were created. These newly created territorial units could then be used as PSUs.

In the other OSCE participating States where the survey was conducted, electoral polling station territories were used as PSUs. Electoral polling station territories were also used in Kosovo. These units are quite small, the borders of each territory are known, and population sizes are regularly updated, which made them suitable candidates for PSUs.

Table 4.2 provides additional details on lists of PSUs used across each of the OSCE participating States surveyed. Table 4.3 provides the same details for Kosovo.

Table 4.2. Sample frames and PSU lists in the OSCE participating States surveyed

	Name of the PSU list	List provider	Update	PSUs	Average PSU size
Albania	List of polling station territories	Electoral commission	2017	Electoral polling station territories	644 voters
Bosnia and Herzegovina	List of census enumeration areas (CEAs)	Agency for Statistics of Bosnia and Herzegovina	2013	Units created by combining several neighbouring CEAs	73 households
Montenegro	List of CEAs	Statistical Office of Montenegro	2011	Units created by combining several neighbouring CEAs	73 households
North Macedonia	List of polling station territories	Electoral commission	2016	Electoral polling station territories	593 voters
Serbia	List of CEAs	Statistical Office of the Republic of Serbia	2011	Units created by combining several neighbouring CEAs	88 households
Moldova	List of polling station territories	Central Electoral Commission	2016	Electoral polling station territories	1,415 voters
Ukraine	List of electoral polling station territories	Central Election Commission of Ukraine	2014	Electoral polling station territories	1,068 voters

Table 4.3. Sample frames and PSU lists in Kosovo

	Name of the PSU list	List provider	Update	PSUs	Average PSU size
Kosovo	List of polling station territories	Electoral commission	2014	Electoral polling station territories	751 voters

4.2. Sampling methodologies

Survey population and sample size

The target population for this survey were women aged 18 to 74 who reside in the OSCE participating States where the survey was conducted. In Kosovo, women aged 18 to 74 who are residents of Kosovo were the target population.

In the majority of the OSCE participating States surveyed, the target sample size was 1,750. The same sample size was targeted in Kosovo. Due to the smaller overall population and an assumed low conflict-affected population, the sample size in Montenegro was 1,150 interviews. In Ukraine, 2,000 interviews were planned, which included a booster of 250 interviews to increase the number of conflict-affected women in the sample (via the addition of 25 sampling points in the areas of the Donetsk and Luhansk regions, covering only those considered safe enough for interviewers to work in at the time of the fieldwork). In Bosnia and Herzegovina, 2,070 interviews were targeted. This was to allow for 1,000 interviews to be conducted in each of the Federation of Bosnia and Herzegovina and Republika Srpska, as well as 70 interviews in the Brčko District. The sample of 1,750 interviews in Kosovo included an oversample of areas predominantly inhabited by Kosovo Serbs, targeting 300 interviews in these areas.

Table 4.4. Sample sizes in the OSCE participating States surveyed

Sample size	
Albania	1,750
Bosnia and Herzegovina	2,070
Montenegro	1,150
North Macedonia	1,750
Serbia	1,750
Moldova	1,750
Ukraine	2,000

Table 4.5. Sample size in Kosovo

Sample size	
Kosovo	1,750

Coverage

The survey aimed to cover the whole population of women aged 18–74 in each of the OSCE participating States surveyed. The same applied in Kosovo. In certain OSCE participating States, however, the actual coverage was slightly lower than 100% either due to non-coverage of the sample frame or due to accommodations that needed to be made for fieldwork practicalities. The fieldwork coverage assumed across the OSCE participating States, along with the description of areas not covered, is given in Table 4.6 below. The same information is provided for Kosovo in Table 4.7.

Table 4.6. Fieldwork coverage in the OSCE Participating States surveyed

	Coverage	Areas not included in coverage
Albania	100%	The sample frame covered all territories in Albania. Due to fieldwork practicalities, PSUs with fewer than 100 voters were excluded from the selection, as these were regarded as remote and secluded. Only six PSUs in Albania were excluded for this reason. These accounted for less than 0.1% of the population.
Bosnia and Herzegovina	97%	The sample frame covered all territories in Bosnia and Herzegovina. Due to fieldwork practicalities, all settlements with fewer than 40 households were excluded, as these were considered to be remote and secluded. Three per cent of the population live in these settlements.
Montenegro	96%	All settlements with fewer than 30 households were excluded – these represented 4% of the population. (Montenegro is a highly mountainous country with a lot of remote villages that have a small number of inhabitants. Since these areas are hard to reach and very small, and therefore impractical to cover, they were excluded from the coverage.) Additionally, homes built or inhabited since 2011 were not covered, because they were not available in the sample frame. The effect this had on coverage was not expected to be large, but the actual proportion is not known.
North Macedonia	99%	The sample frame covered all territories in North Macedonia. Due to fieldwork practicalities, PSUs with fewer than 70 voters were excluded from the selection, as these were usually remote and secluded. They covered 1% of the population.
Serbia	98%	Areas in south Serbia with an Albanian majority (who did not participate in the latest census) were not covered due to their absence from the sampling frame. This population represented 1% of the total population. Additionally, addresses established or inhabited since 2011 were not covered, because they were not available in the sample frame. The effect this had on coverage was not expected to be large, but the actual proportion is not known. Finally, all settlements with fewer than 30 households were excluded, as these were considered to be remote and secluded. They represented 1% of the population.

Moldova ¹²	99%	The sample frame covered all territories in Moldova. Due to fieldwork practicalities, localities with fewer than 300 registered voters were excluded from the coverage. These were usually very small villages with difficult access (poorly developed roads). These represented 1% of the population of voters.
Ukraine	84%	The survey could not cover non-government-controlled areas or areas near the contact line. In practice, this meant that the Autonomous Republic of Crimea could not be covered, in addition to parts of the Donetsk and Luhansk regions. In total, an estimated 16% of the Ukrainian population were living in areas that were inaccessible for the survey. Additionally, PSUs with fewer than 100 voters were excluded from the selection, as these were regarded as remote and secluded. These areas covered 0.1% of the population.

Table 4.7. Fieldwork coverage in Kosovo

	Coverage	Areas not included in coverage
Kosovo	100%	The sample frame covered all territories in Kosovo. Due to fieldwork practicalities, PSUs with fewer than 100 voters were excluded from the selection, as these were regarded as remote and secluded. Only five PSUs in Kosovo were excluded for this reason. These accounted for less than 0.1% of the population.

Sample design

In each of the OSCE participating States surveyed, a multistage, stratified, random probability sample was designed. The same was used in Kosovo. This approach assumes that each individual has a known and non-zero chance of being included in the sample (with the appropriate coverage restrictions; see Tables 4.6 and 4.7).

Stages of sample selection

Stage 1: Selection of primary sampling units.

Stage 2: Selection of addresses/dwellings.

Stage 3: Selection of households at each address/dwelling. There is usually a one-to-one relationship between households and addresses. In a small number of cases, however, there may be more than one household at one address – a possibility that was accounted for.

Stage 4: Selection of respondents in each household.

Stratification

Stratification increases the precision of survey estimates if done correctly and if variables are used that are linked to the key survey variables. In all the OSCE participating States surveyed, a combination of region and rural/urban classification was used as a stratification variable.

¹² Transdniestria was not covered by the survey and is not included in the coverage calculation.

In Kosovo, a combination of region and rural/urban classification was used as a stratification variable, and an additional layer of stratification was used that separated areas with a predominantly Albanian population and those areas with a predominantly Serbian population.

Prior to the sample selection, PSUs were distributed across strata in accordance with the proportions in the survey population across strata.

Selection in each sampling stage

Stage 1: Within each stratum, PSUs were selected randomly, with probability proportional to size (PPS).

Stage 2: A set number of addresses was selected within each sampled PSU. Addresses were selected randomly or deterministically (both being independent of enumerator/interviewer judgement), either from the registry, prior to the start of fieldwork or at the time of the interview, following the random walk rules specified for this survey.

Stage 3: When more than one household was identified at a selected address, the electronic contact sheet randomly selected one household.

Stage 4: In each sampled household, one woman was selected for the interview. The respondent was selected randomly from the list of all eligible women in a selected household. Namely, all women aged 18–74 within the household were listed by age in descending order in the electronic contact sheet. Then the contact sheet application used a random-number generator to select one of them.

No substitutions of selected households or respondents were permitted once the selection was made. Interviewers were required to make a minimum of three visits (contact attempts) to each selected household to establish eligibility and secure an interview to maximize the response rate.

Phased fieldwork start

To achieve a design that gives all households in the population a nearly equal chance of being selected for the sample, the PSUs were selected with probability proportional to their size within each stratum, and then a fixed number of addresses to be visited was selected in each PSU. A final outcome was required at each of these addresses regardless of the number of interviews completed per PSU. Hence, the number of interviews achieved per PSU was not necessarily equal to 10. However, the overall sample design aimed to achieve the total number of interviews across all issued PSUs.

To calculate the number of addresses to be issued per PSU, estimates of the eligibility rate and response rate expected in each stratum were used. Given the particularity of the survey topic and the requirement that interviews be conducted in private, these estimates could not be precise. Hence, only half of the randomly selected PSUs were issued for the first phase of fieldwork. Then, based on the achieved response rates across the strata and the remaining number of interviews to be completed, the number of addresses to be issued per PSU was adjusted for the second phase of the fieldwork.

The response rates achieved in the first phase of fieldwork in Montenegro proved to be lower than expected, so an additional 25 PSUs were issued to achieve a balanced number of interviews across PSUs. Similarly, the response rate in the first phase of fieldwork was significantly lower than expected in the Brčko District of Bosnia and Herzegovina, so an additional seven PSUs were issued there for the second phase of fieldwork.

Tables 4.8 to 4.14 provide the final PSU allocation across strata in each of the OSCE participating States surveyed. Table 4.15 gives the same information for Kosovo.

Table 4.8. PSU allocation across strata in Albania¹³

Region	Urban	Rural	Total
North Albania	14	20	34

5. Pilot study

A pilot study was conducted in November and December 2017 in the OSCE participating States that took part in the survey. A pilot study was also conducted in Kosovo during this period. The aim of the pilot study was to test every element of the quantitative survey, including the interviewer briefings, sampling approach and tools, questionnaire and other fieldwork materials.

A total of 285 interviews were carried out during the pilot. In Albania, Montenegro, North Macedonia and Moldova, 35–37 interviews were conducted with randomly selected women following the full sampling methodology to be used for the main part of the fieldwork. In Bosnia and Herzegovina, Serbia and Ukraine, around 20 interviews were conducted with randomly selected women and 15 with conflict-affected women recruited to take part to ensure that the conflict module questions could be sufficiently tested. In Kosovo, 20 interviews were conducted with randomly selected women and 15 with conflict-affected women.

Briefings and interviewer manual

The pilot briefings were conducted over the course of one day. In Kosovo, two briefings were held: one for Kosovo Albanian interviewers and the other for Kosovo Serbian interviewers. The feedback on the briefings from interviewers and the local project managers was very positive overall. The briefings helped the interviewers understand the objectives of the survey and issues related to violence against women and girls. According to the interviewers who took part in the briefings, they provided a good overview of the interviewers' role in the study and advice on how to present the survey. The briefings also highlighted the sensitive nature of the research and prepared interviewers for the potential reactions respondents might have during the interviews.

As with the briefing sessions, feedback on the training manual was positive. It was seen to be comprehensive and useful.

The content and structure of both the training sessions and the manual remained largely unchanged from the pilot. Only a few changes or additions were requested by the interviewers or the local project managers.

Sampling

The approach to selecting addresses used in the pilot was generally found to have worked well. Interviewers did not report any particular difficulties with following the random walk rules or in the selection of eligible women to take part in the survey. Therefore, no changes were made to the sampling approach. The pilot questionnaires were conducted in PSUs not selected for the main study sample.

Gaining respondent co-operation

Some respondents did not think that the wording of the introduction was persuasive enough. The introduction and the letter were therefore revised to try to make them more convincing to help sell the survey to respondents. In addition, the survey introduction was amended to state that the interview could take more than 60 minutes instead of 45 minutes, so as to better reflect the actual length.

Otherwise, no major changes were required to the survey introduction.

Electronic contact sheets

The electronic contact sheets worked well and were found to be easy to use. In Albania and Moldova, interviewers did not record unsuccessful visits, contrary to the instructions that they were given.

The electronic contact sheets included a feature that required that the GPS co-ordinates of each visited address be recorded. There was a wide variation in how often this feature could be used due to technical issues, which meant that the feature did not work properly on older devices. GPS co-ordinates were successfully recorded for about 80% of visited addresses in Bosnia and Herzegovina and in Moldova but only in a handful of cases in Ukraine.

No changes to the contact sheets were made. During the interviewer training sessions, however, the importance of completing contact sheets at all addresses was stressed. The local project managers were advised to monitor whether outcomes for all issued addresses were being collected via the sampling management system during fieldwork. In the subsequent training sessions and the main fieldwork, the importance of recording the GPS co-ordinates was repeatedly emphasized to all the interviewers. Monitoring of the proportion of successfully recorded GPS co-ordinates was incorporated into the fieldwork monitoring system, and any interviews without GPS co-ordinates and without any explanation as to why that was the case were checked. New CAPI devices were used in all PSUs selected for the main fieldwork as far as possible.

Conducting interviews in private

Interviewers understood the importance of carrying out interviews in a private location where respondents' confidentiality would not be compromised and where interruptions would be minimized. Overall, interviewers appear to have handled any interruptions during the interviews well and in accordance with the guidelines provided to them. These real-life cases were discussed during the main briefings.

Most respondents in the pilot survey filled out the self-completion section, with both the CAPI and paper versions being used, so both options were offered during the main survey.

Questionnaire content and administration

The main issue found concerning the questionnaire was its overall length. Some respondents complained that the interview was too long, and interviewers reported respondents losing concentration and interest as the survey progressed, with some speeding up their responses to complete the survey in less time.

The sensitive nature of some of the questions was also problematic for some respondents, but this was not unexpected. Emotional reactions were most often triggered by the conflict-related questions, particularly among those who had experienced serious violent incidents. While most respondents disclosed their experiences, interviewers reported some cases where they felt the respondent was not disclosing everything they had experienced. Respondents tended to be most uncomfortable with questions regarding sexual violence.

Ensuring interviewers themselves were comfortable with asking these questions was acknowledged as an important first step in maximizing disclosure. At the briefings and in the interviewer manual, interviewers were advised to be confident in reading out sensitive questions and to practise reading them out loud before starting fieldwork. In addition, an introductory sentence prior to each set of questions on sexual violence was added to the questionnaire. This warned respondents that the next set of questions would be sensitive and might make them feel uncomfortable, which is understandable. Respondents were then reminded that their responses were confidential and that they did not need to answer any questions they did not wish to.

There were no major issues with overall comprehension of individual questions, and only small amendments were made on the basis of the pilot fieldwork.

Identifying the most serious incident was problematic for some respondents, as they did not consider any incident to be serious. There was already an instruction to interviewers to ask the respondent to refer to the most recent incident in these cases, but this issue was highlighted in the briefings. Other than that, there were no major issues with overall comprehension of individual questions due to either their formulation or their translation.

The item non-response (INR) for the combined data for all seven OSCE participating States surveyed and for Kosovo was examined. For the most part, the INR seemed reasonable

given the questions, but in a couple of cases further action was taken in respect of translation and interviewer instructions.

6. Quantitative fieldwork

This chapter provides an overview of the main fieldwork, detailing the final achieved samples, fieldwork progress, procedures and outcomes.

6.1. Fieldwork dates and progress

Fieldwork started in April 2018 in the majority of the OSCE participating States surveyed. Fieldwork also started in Kosovo in April 2018. The fieldwork was completed in 20 weeks, on average, ranging from 14 weeks in Bosnia and Herzegovina and Ukraine to 22 weeks in Moldova.

Table 6.1. Fieldwork dates in OSCE participating States

	Fieldwork dates
Albania	4 April to 27 August 2018
Bosnia and Herzegovina	27 May to 31 August 2018
Montenegro	5 April to 20 August 2018
North Macedonia	2 April to 1 August 2018
Serbia	3 April to 5 August 2018
Moldova	17 April to 21 September 2018
Ukraine	2 April to 17 September 2018

Table 6.2. Fieldwork dates in Kosovo

	Fieldwork dates
Kosovo	1 April to 19 August 2018

The start of fieldwork in Bosnia and Herzegovina was delayed due to issues with obtaining the sampling frame and up-to-date maps for interviewers (as discussed in Chapter 4). In Ukraine, there was a period of 11 weeks when fieldwork was put on hiatus while the implementation of the sampling plan was reviewed (see below). Aside from this, fieldwork was put on hiatus only for national and religious holidays, which typically did not last more than one or two days.

Ipsos provided the OSCE with fieldwork progress updates on a weekly basis. Information provided included the number of interviews completed, the number of addresses contacted, the outcomes of contacts at each address, eligibility of the contacted addresses and response rates. A qualitative assessment of fieldwork progress was also provided by each local agency on a weekly basis. This allowed for any issues in the implementation of the sampling plan to be recognized as early as possible and corrective measures put in place if necessary.

The only significant deviation from the sampling plan took place in Ukraine, where it was recognized through the fieldwork progress updates that too many addresses were being contacted in some PSUs and too few in others. To rectify this, fieldwork was put on hold while the full contact history in each PSU was reviewed. This resulted in some interviews being removed from the sample, as they were conducted at addresses that should not have been contacted. Fieldwork had to be continued in some PSUs where it had been stopped prematurely before all the issued addresses had been contacted. Interviewers were briefed

once again following the hiatus and reminded of the rules regarding the number of addresses to be contacted in each PSU.

6.2. Making contact and contact sheets

Interviewers were required to make contact with respondents face-to-face using an electronic contact sheet integrated within the CAPI platform to record the outcome of all visits, to screen households and to make a random selection of one eligible household member to participate in the interview. The contact sheet was programmed into the CAPI device, and the selection of the potential respondents from all eligible women in the households (and the designation of the sampled household in case of multi-household addresses) was made by the device via a random-number generator.

At least three visits were required at each selected address before registering a final outcome unless an interview was carried out, the household or respondent refused to take part, or it was established that the address or household was not eligible to take part. Only private dwellings that were occupied as a main residence and had women aged 18–74 living there were considered eligible. Contact attempts had to be made on different days, at the weekend and at different times of the day wherever possible.

The number of contacts made at each address are summarized in the tables below.

Table 6.3. Contact attempts per issued address in each OSCE participating State surveyed

	Minimum	Maximum	Mean
Albania	1	4	1.2
Bosnia and Herzegovina	1	4	1.4
Montenegro	1	4	1.3
North Macedonia	1	4	1.6
Serbia	1	4	1.5
Moldova	1	4	1.5
Ukraine	1	4	1.6

Table 6.4. Contact attempts per issued address in Kosovo

	Minimum	Maximum	Mean
Kosovo	1	4	1.3

6.3. Interview administration

All interviews were conducted face-to-face using CAPI. All interviewers were instructed to introduce the survey by saying it concerned women's well-being and safety.

Due to the sensitivity of the data being collected, interviewers were instructed that interviews should be conducted in private with only children under the age of 2 allowed to be present during the interview. Only once privacy was secured with the selected respondent could further details about the specific subject matter be discussed.

Where privacy could not be secured or the interview was interrupted by other members of the household, interviewers were instructed to arrange a different time or place for the interview to continue whenever possible.

According to interviewer feedback, 95% of interviews were conducted in complete privacy. Of the 614 interviews that did not happen in private, children were present some or all of the time in 260 cases, the woman's partner in 169 cases, another family member in 157 cases, a friend in 47 cases and some other person (a neighbour or a guest) in 67 cases.

The presence of others was most common for the first three sections of the questionnaire. In 3% of cases, someone was present during the introduction. For the sections regarding experiences of harassment, partner and non-partner violence, stalking and childhood violence, someone else was present for a maximum of 1% of interviews. After an assessment of the prevalence of violence revealed by these interviews compared with those conducted in complete privacy, the declared rates of abuse were not systematically different. Based on this assessment, these interviews were not excluded.

Self-completion questions

Due to concerns that women interviewed would not want to discuss their experiences of physical or sexual violence, a short self-completion questionnaire was administered at the end of the survey that was completed by 11,796 respondents (78% of the total sample). Respondents had the choice of completing these questions on the CAPI device or, if they preferred, completing the questionnaire on paper and placing it in a sealed envelope before returning it to the interviewer. In the latter case, the data was later entered using a unique ID to link it to the rest of the interview responses. The self-completion questions were completed on the CAPI device by 10,041 respondents and on paper by 1,753 respondents.

Showcards

Showcards were used to show respondents lists of responses to certain questions from which they could select their answer(s). For some questions, the codes on the showcards were presented in standard (i.e., codes listed A–E) and reverse order (i.e., E–A) to help mitigate any order effect, i.e., codes from the top or bottom of the list being selected due to their position on the showcard. Each pack of showcards included only one version – either standard or reverse – and interviewers were given one or the other to use for all of their interviews.

6.4. Fieldwork support materials

Introductory letter

An introductory letter providing some background to the survey, including the survey sponsor (the OSCE), was provided to all respondents at the beginning of the interview. As with the interviewer introduction, in order not to alert other household members as to the precise nature of the survey, the letter said the survey was about women's well-being and safety and not about experiences of violence.

List of support organizations

At the end of the interview, all respondents were offered information on support organizations that they could contact should they wish to discuss any issues arising as a result of taking part in the survey. If it was thought that a respondent was not able to read the information or did not want to take a hard copy of the information, then interviewers

were instructed to provide the information verbally instead. The list of support organizations was prepared by the local fieldwork agencies and approved by the OSCE.

Overall, 75% of women took the information without making any comment, while 16% said that they did not want the information. Thirteen per cent said they had not heard of the organizations, while 3% stated that they did not believe that the organizations could help.

Incentives

In Moldova, Serbia and Ukraine, respondents were offered a small gift of low monetary value (between one and three euros) at the end of the interview as a way of saying thank you for the time they spent completing the interview.

6.5. Interview length

The average interview length overall was 43.5 minutes, while the median was 42 minutes. The shortest interviews were 20 minutes and the longest 133 minutes. This was calculated starting from when the respondent was asked the first question and ending before the Interviewer Assessment section at the end of the questionnaire. It does not include time spent establishing eligibility or for respondent selection. The tables below provide the average, median, minimum and maximum interview duration by place of interview.

Table 6.5. Average, median, minimum and maximum interview length in number of minutes, by OSCE participating State

	Average	Median	Minimum	Maximum
Albania	40	39	20	92
Bosnia and Herzegovina	48	47	20	110
Montenegro	42	39	21	125
North Macedonia	44	42	20	103
Serbia	48	47	21	110
Moldova	39	35	20	105
Ukraine	44	43	22	133

Table 6.6. Average, median, minimum and maximum interview length in number of minutes in Kosovo

	Average	Median	Minimum	Maximum
Kosovo	40	39	20	92

6.6. Achieved sample profiles

The table below provides details on the overall sample profile by age, work status, rural/urban classification and whether women were conflict-affected or not. The profile achieved for each of the OSCE participating States is provided in Annex 3. The profile achieved for Kosovo is also provided in Annex 3.

Table 6.7. Demographic breakdown of achieved sample

Age	Weighted %	Unweighted %	Unweighted n
18–29	20	17	2,537
30–39	20	18	2,770
40–49	18	19	2,846
50–59	19	19	2,955

Language barrier with target respondent	8
Away/in hospital throughout field period	8
Ill at home during field period	3
Other non-response	12
Non-contact	
No contact with anyone at the address	69
Respondent selection made, but no contact with target respondent	2
Address inaccessible (register samples only)	-
Address not found (register samples only)	-
Complete interview by target respondent	
Interviews deleted for quality control	30
Eligibility rate	
Eligibility rate	96%
Response rate	
Response rate	59%

The eligibility rate is calculated as follows:

$$e = \frac{\text{CEH}}{\text{CEH} + \text{CIH}}$$

where CEH = confirmed eligible households and CIH = confirmed ineligible households

The number of **eligible** addresses is based on addresses that were given a final outcome code of:

- Refusal by target respondent before the interview;
- Refusal by proxy (other household member) after respondent selection;
- Unable to secure privacy for the interview;
- Physically or mentally unable;
- Language barrier with target respondent;
- Away/in hospital throughout field period;
- Ill at home during field period;
- Screening and respondent selection made, but no contact with target respondent;
- Complete interview by target respondent(s).

The number of **ineligible** addresses is based on addresses that were given a final outcome code of:

- Resident household(s), but not eligible for the survey.

The response rate is calculated as follows and in accordance with the RR3 definition of response rates by the American Association for Public Opinion Research.¹⁴

$$\text{Response rate} = \frac{I}{\text{CEH} + e(\text{UE})}$$

where I = complete interview by target respondent and UE = households where eligibility is unknown.

The interviews deleted for quality control purposes were not included for the calculation of the eligibility and response rates.

¹⁴ *Standard Definitions: Final Dispositions of Case Codes and Outcome Rates for Surveys*, 7th edition (Oakbrook Terrace, IL: The American Association for Public Opinion Research, 2011), p. 46.

6.8. Fieldwork quality control

A number of steps were taken to assure the quality of the data collected during fieldwork.

Telephone checks were conducted on a minimum of 15% of completed interviews. This process aimed to verify if data had been gathered from genuine respondents and whether interviews had been conducted correctly and in line with survey requirements. During this validation procedure, the following aspects were checked:

- Whether the respondent was interviewed;
- Where the interview was conducted;
- How long the interview was;
- If the respondent knew the interviewer socially;
- The interview mode (CAPI/paper);
- Several (non-sensitive) questions from the questionnaire (such as age, working status, marital status, number of children in the household);
- Use of showcards;
- The interviewer's general behaviour and attitude.

If problems were detected, the local fieldwork agencies were required to increase the number of checks carried out. Where serious problems were identified, the interviewer was removed from the project, and their interviews were excluded from the final data. In less serious cases, interviewers were briefed again in an effort to prevent future errors.

Some interviewers (besides those with less than three months of interviewing experience) were accompanied by supervisors for the first days of their fieldwork. Supervision lasted until supervisors confirmed that the interviewers could conduct fieldwork on their own. This supervision focused mainly on monitoring the way the interviewer selected the household and respondent, information given on the doorstep, how the respondent was persuaded to participate and each interviewer's general behaviour.

GPS co-ordinates were checked to make sure that the random walk procedures were implemented as required. GPS co-ordinates could not always be accurately collected, particularly in rural areas (which sometimes showed locations in a completely different place), but where they were recorded properly, the review of collected GPS co-ordinates did not show any errors in the random walk procedures.

Reasons for deleted interviews

As noted in Tables 6.8 and 6.9, several interviews were deleted for quality control purposes following the verification process described above or due to some other irregularity, as summarized in the tables below.

Table 6.10. Reasons for deleting interviews in the OSCE participating States surveyed

	Number of interviews deleted for quality control purposes	Reasons for deleting interviews
Albania	115	Interviews under 20 minutes, incorrect selection of respondent because not all eligible women who could take part were listed, interviews not confirmed during verification process. Four interviewers in particular were found to have problematic interviews for the latter reason. They were removed from the project, and all their interviews were deleted, hence the relatively high number of interviews removed for quality control purposes in Albania.
Bosnia and Herzegovina	6	Incorrect selection of respondent because not all eligible women who could take part were listed
Montenegro	23	Interview duration of less than 20 minutes
North Macedonia	12	Interview duration of less than 20 minutes, high level of “don’t know” and “refused” responses throughout the questionnaire
Serbia	36	Interview duration of less than 20 minutes, high level of “don’t know” and “refused” responses throughout the questionnaire
Moldova	16	Interview duration of less than 20 minutes, incorrect selection of respondent because not all eligible women who could take part were listed
Ukraine	26	High level of “don’t know” and “refused” responses throughout the questionnaire, interviews not confirmed by respondents during the verification process

Table 6.11. Reasons for deleting interviews in Kosovo

	Number of interviews deleted for quality control purposes	Reasons for deleting interviews
Kosovo	30	Interviews under 20 minutes, incorrect selection of respondent because not all eligible women who could take part were listed, interviews not confirmed during the verification process.

7. Qualitative fieldwork

This chapter provides an overview of the objectives of the qualitative fieldwork, which included key expert interviews with a range of stakeholders and key actors working in fields related to violence against women, focus group discussions with women and in-depth interviews with survivors of violence.

7.1. Key expert interviews

Up to 15 key expert interviews were conducted in each of the OSCE participating States surveyed. Another 15 key expert interviews were conducted in Kosovo. Between five and seven of these interviews were conducted during the background research phase, and the remainder were conducted alongside the main fieldwork.

The interviews were conducted with representatives of international organizations, government, NGOs and with individuals working in academic or legal roles related to VAWG. Relevant experts working in these areas were identified by the OSCE, and their contact details were provided, along with an introductory email template for making contact. Recruitment was handled by the local research agencies, who contacted the experts to invite them to take part in an interview.

Researchers conducted the interviews using a semi-structured discussion guide to ensure all areas of interest were covered. The discussion guides were drafted by Ipsos in collaboration with the OSCE and, once finalized, were translated into the relevant languages.

The interviews in the background research focused on:

- The extent and nature of VAWG/GBV;
- The measures that were in place to prevent VAWG/GBV;
- The services that exist for victims of VAWG/GBV;
- The legal recourse that is available to victims;
- The extent to which legal recourse is implemented.

The interviews conducted during the main fieldwork focused on:

- Any changes that had taken place since the initial key expert interviews that affected, or were expected to affect, how VAWG is handled in each of the seven participating States surveyed. The same applied in Kosovo.
- Experts' recommendations for preventing and responding to VAWG in each of the OSCE participating States where the survey was conducted. The same applied in Kosovo.
- How the OSCE could engage with policymakers and key organizations to encourage them to use the survey's findings.

Each interview lasted for around an hour and was conducted either face-to-face or by telephone, depending on the expert's preference. With permission, researchers used a digital voice recorder.

Five interviews were fully transcribed (and translated into English), while structured notes were prepared (in English) from the other interviews.

The tables below provide details on the number of interviews completed and the fieldwork period.

Table 7.1. Key expert interviews conducted in the OSCE participating States surveyed

	Number of interviews conducted during background research	Fieldwork dates for interviews conducted during the background research	Number of interviews conducted during the main research	Fieldwork dates for interviews conducted during the main research
Albania	5	June–July 2017	9	June–August 2018
Bosnia and Herzegovina	5	June–August 2017	10	July–August 2018
Montenegro	6	June–August 2017	9	July 2018
North Macedonia	5	June–July 2017	11	June–August 2018
Serbia	7	March–April 2017	7	June–July 2018
Moldova	5	June 2017	10	June–July 2018
Ukraine	5	July–August 2017	10	July–August 2018

Table 7.2. Key expert interviews conducted in Kosovo

	Number of interviews conducted during background research	Fieldwork dates for interviews conducted during the background research	Number of interviews conducted during the main research	Fieldwork dates for interviews conducted during the main research
Kosovo	5	June–July 2017	10	June–September 2018

7.2. Focus group discussions

Between seven and nine focus group discussions (FGDs) were conducted in each of the OSCE participating States surveyed, one of which was conducted as a pilot discussion group. Nine focus group discussions were conducted in Kosovo, including one pilot discussion group.

Focus group composition and fieldwork dates

The sample for the FGDs was designed to ensure that women from a range of age groups were included, that urban and rural areas were covered and that some of the groups included women who were conflict-affected. Respondents were defined as being conflict-affected if they had lived through a period of conflict for at least one week during their adult lifetime. Table 7.3 details additional quotas that were requested within groups to ensure that a broad representation of women was included.

Table 7.3. Additional quotas across all groups

Criteria	To include a mix of:
Relationship status	- Single - Married/co-habiting - Separated/divorced/widowed
Children	- Yes - No
Work status	- Working: employed/self-employed - Not working: unemployed, studying or training, domestic work/caring for family, unable to work due to illness or disability, retired
Education	- Completed secondary education or less - Completed university (bachelor's degree) or technical school
Criteria	To record:
Disability	- Yes - No
Ethnicity (where ethnicity has not been specified for the group itself)	- Specific to each place

The final composition of the focus groups was as follows.

Table 7.4. Composition of focus groups in Albania

FG	Location	Number of participants	Age group	Ethnicity	Number conflict-affected	Number with children	Number working
1	Rural	8	40–53	Albanian	8	6	3

Ukraine	13 November 2017	8–18 June 2018

Table 7.13. Fieldwork dates of the focus group discussions in Kosovo

	Pilot FGD dates	Main FGD dates
Kosovo	19 December 2017	19 June to 9 July 2018

Recruitment and incentives

Recruitment of participants was handled by the local fieldwork agencies. Participants for the groups were mostly found through free-find recruitment methods by specialist qualitative recruiters. For some of the groups, women of specific ethnicities or nationalities were recruited with the assistance of local NGOs.

A screening questionnaire that included an introduction to the research was used during recruitment to ensure that the quotas were met and that the research was explained clearly and consistently. Women invited to take part in a focus group discussion were told what the group would cover during the recruitment stage.

Participants were given an incentive, which is standard practice for qualitative research. The incentives provided are summarized in Tables 7.14 and 7.15 and were aligned with the usual incentive levels for this kind of research.

Table 7.14. Incentives provided to FGD participants in the OSCE participating States surveyed

	Incentive type	Approximate value in euros
Albania	Voucher	15
Bosnia and Herzegovina	Voucher for DM drugstore	13
Montenegro	Money	20
North Macedonia	Voucher	16
Serbia	Money	17
Moldova	Money	15
Ukraine	Money	16

Table 7.15. Incentives provided to FGD participants in Kosovo

	Incentive type	Approximate value in euros
Kosovo	Voucher for supermarket chain	15

FGD implementation

Researchers from the local fieldwork agencies conducted the FGDs in the OSCE participating States surveyed. In Kosovo, researchers from the local fieldwork agency and from the Kosovo Women's Network conducted the FGDs. A semi-structured discussion guide was used to ensure all areas of interest were covered, including:

- Societal attitudes towards women generally and towards VAWG and perpetrators in particular;
 - How this has changed over time, including in times of conflict;
- Awareness of, and views on, existing support and barriers to disclosure;
- How prevention and support could be improved.

The topic guide was designed by Ipsos and the ICRW in collaboration with the OSCE. A pilot FGD was held in each of the OSCE participating States surveyed. A pilot FGD was also held in Kosovo.

In general, the discussions went well, and the moderators reported that participants were open to taking part and were engaged. Some moderators reported that women were particularly glad to take part in such a project and that the subject was getting attention, as they felt that VAWG was a serious issue in their country. Participants also seemed to be pleased to receive, at the end of the discussion, a list of organizations specializing in providing support for victims of violence.

On the whole, there were no significant issues with understanding or taking part in the discussion. There were some issues with two activities that were difficult to explain and that took more time than planned. The first was a "gender box" activity, which required participants to write comments on how they thought women were expected to behave. Moderators reported that it took a lot of probing to get responses and that women found it difficult to generalize. This was replaced with the following scenario:

"I'd like to ask you about what you think it is like to be a woman in <country/region> today. First of all, what are the good things about being a woman in <country/region> today? What are the bad things?"

A series of probing questions were then used to explore different areas of life and different expectations of men and women.

The second activity that respondents were reported to find difficult was plotting events on a timeline and discussing which events in the area they felt had an impact on violence against women. Respondents could either identify only one major event (e.g., an armed conflict) or were unable to identify any according to a specific time. As a result, it was agreed to instead explore this thematically and to ask women about different factors – economic, political or social – that they felt had had an impact.

Each FGD lasted around two hours. With permission, researchers recorded the discussion using a digital voice recorder. At the end of the group discussion, the women were offered a referral sheet detailing local organizations and services for survivors of VAWG.

A set of structured notes was completed for the FGDs, and five of the FGDs in each OSCE participating State were transcribed in full and translated into English. The same was done in Kosovo.

7.3. In-depth interviews

Between four and six in-depth interviews (IDIs) were conducted in each of the OSCE participating States surveyed. Four IDIs were conducted in Kosovo. The IDIs were conducted with women who had experiences of violence.

Profile of in-depth interviews and fieldwork dates

All the IDIs were conducted with women who had experience of violence. As far as possible, the sample of the IDIs was designed to cover women belonging to disabled, ethnic and other minorities to provide more insight into the particular challenges these groups of women face. An overview of the IDIs is provided in the tables below.

Table 7.16. Profile of IDI participants in Albania

IDI	Age group	Work status	Has children	Medical condition/disability
1	35–55	Unemployed	Yes	Yes
2	35–55	Unemployed	Yes	Yes
3	55+	Unemployed	Yes	Yes
4	18–34	Employed	Yes	No

Table 7.25. Fieldwork dates of the in-depth interviews in Kosovo

	Pilot IDI dates	Main IDI dates
Kosovo	12 January 2018	17 July to 20 August 2018

Recruitment and incentives

It had originally been planned that the sample from the IDIs would be generated from the quantitative survey sample. A question was included at the end of the survey asking respondents if they were willing to take part in further research. While some of the women were recruited for the IDIs in this manner, others were recruited with the assistance of local NGOs that provide support to women who have experienced violence. This approach was taken because of the limited number of women who fit the recruitment criteria and who agreed to be contacted again.

Women who were eligible to take part from the survey sample were called by one of the qualitative researchers at the local fieldwork agency to explain what the in-depth interview would involve and to find out if the women would like to take part and to ensure that the potential respondents were aware of the details they would be asked about, so they could make an informed decision about further participation. The researcher used these calls to find out if the women had sought support for their experiences of violence, and also to find out how they felt after taking part in the survey to assess the possible level of risk to the women if they were to take part in an IDI.

As with the FGDs, incentives were provided to all the women who took part in the in-depth interviews as a token of appreciation for their time. The incentives are as listed in Tables 7.14 and 7.15.

IDI implementation

Researchers conducted the in-depth interviews using a semi-structured discussion guide. In Kosovo, researchers from the local fieldwork agency and from the Kosovo Women's Network conducted the IDIs. Each interview covered the woman's life story from childhood to the day of the interview, with a focus on her experiences of violence, the impact this had on her and what, if any, support she had accessed or received. One test interview was conducted in Albania. One test interview was also conducted in Kosovo. The feedback from these test interviews was used to make any necessary changes to the guide.

Each interview lasted up to three hours, and, with permission, researchers used a digital voice recorder. At the end of the interview, women were offered a referral sheet detailing local organizations and services for survivors of VAWG.

Each interview was transcribed and translated (where the participant gave permission for a recording to be made), and a set of structured notes was also completed by the interviewer.

8. Weighting

This section describes the weighting procedures applied in this survey. The weights for each of the OSCE participating States were calculated in two stages: a) sampling design weights; and b) post-stratification weights. The same approach was used in Kosovo.

8.1. Sampling design weights

Design weights were calculated to compensate for the uneven probabilities of respondent selection. The following probabilities of each of the sample selection stages were calculated:

- A1: probability of selecting a PSU
- A2: probability of selecting an address
- A3: probability of selecting a household within an address
- A4: probability of selecting a respondent within a household

Design weights were then calculated as an inverted product of the four probabilities described above.

$$Wt_{design} = \frac{1}{A1 * A2 * A3 * A4}$$

A1. Probability of selecting a PSU

Within each stratum, the allocated number of PSUs was selected randomly with probability proportional to size (PPS). In Bosnia and Herzegovina, Montenegro and Serbia, the total number of households within each PSU was used as the PPS size measure. In other OSCE participating States, this was not available, and the number of registered voters was used instead. The same was used in Kosovo. The probability of the selection of a PSU in this stage was:

*A1 = number of PSUs selected in stratum h * size of the selected PSU / sum of the sizes of all PSUs in stratum h*

A2. Probability of selecting an address

In the next stage, addresses were selected randomly from all addresses in the PSU. The probability of the selection of each address (conditional on the selection of its PSU) was:

A2 = number of selected addresses / number of all addresses in the PSU

The number of issued addresses (gross sample) was used as the number of selected addresses in this formula. This approach allowed for the calculation of the actual likelihood of someone being selected to take part in the survey regardless of whether they chose to take part or not (assuming an equal eligibility rate across all strata and PSUs).

In the OSCE participating States where the number of addresses (or households) per PSU was not available, the number was estimated using the official statistics on the average number of voters per household/address. The same was applied in Kosovo.

A3. Probability of selecting a household within an address

When, during the fieldwork, an interviewer found more than one household at the selected address, the electronic contact sheet selected one randomly. The probability of selection of a household (conditional on the selection of its address) was:

$$A3 = 1 / \text{number of households at the address}$$

A4. Probability of selecting a respondent within a household

Whenever a household contained more than one eligible woman in the household, the electronic contact sheet selected one randomly. The probability of a respondent being selected (conditional on the selection of their household) was:

$$A4 = 1 / \text{number of eligible women in the household}$$

8.2. Post-stratification weights

After applying the sampling design weights, the post-stratification weights were calculated to compensate for non-response. Random iterative method weighting was used for calculating the post-stratification weights. The available statistics on the target population proportions across the following variables were used: region by rural/urban classification and age categories (18–29, 30–39, 40–49, 50–59, 60–74).¹⁵

As explained in Chapter 4, the samples for Bosnia and Herzegovina and for Ukraine oversampled certain parts of their territories. The sample that was used for Kosovo also oversampled certain parts of the territory.

- Republika Srpska and the Brčko District were over-represented in the sample for Bosnia and Herzegovina.
- Government-controlled areas were over-represented in the sample for Ukraine.
- Areas predominantly inhabited by Kosovo Serbs were oversampled in the sample used for Kosovo.

These deliberate biases in the sampling design served the purpose of better representing oversampled subpopulations and were corrected in the post-stratification weighting stage, so that the proportion of the population living in each of the oversampled areas in the final weighted samples represented their actual share in the overall target population of these OSCE participating States. The same approach was used in Kosovo.

In Bosnia and Herzegovina, two additional weights were calculated in addition to the overall weight that enabled analysis at the level of the entire territory of Bosnia and Herzegovina. The two weights were calculated to allow reporting for the Federation of Bosnia and Herzegovina and for Republika Srpska separately (entity-level weights).

The resulting weights for each OSCE participating State were then calibrated to an average of 1, so that the sum of the weights would equal the sample size. The same was done for the entity-level weights in Bosnia and Herzegovina. This procedure was also applied in Kosovo.

Trimming/capping of the weights

It is crucial that the optimal balance be found between bias and variance. Capping the weights represents one of the major points where the right balance between the two needs to be found. Researchers often prefer to limit the impact of the largest weights on variance to avoid increasing the bias. At the same time, because the smallest weights do not have the same degree of detrimental impact on the variance, there is usually no cap placed on the smallest weights. In this survey, in the OSCE participating States where no oversampling was used, the largest weights were capped at a value 10 times larger than the minimum weight. The same was applied for the entity-level weights in Bosnia and Herzegovina. Due to the oversampling in Bosnia and Herzegovina and Ukraine, the lowest weights were lower

¹⁵ A few missing values in the age variable were assigned to the mode value for the purposes of weighting.

than in other OSCE participating States, so the largest weights were capped at the 95th percentile of the distribution. Due to the oversampling, the same was applied in Kosovo.

8.3. Population weights

Finally, an additional weight (population weight) was calculated to allow reporting for the entire sample of all OSCE participating States or for a group thereof. The same approach was used in Kosovo. This weight reflects the distribution of the survey population across the OSCE participating States. The weight also reflects the distribution of the survey population in Kosovo. The population weights used the actual sampling rate in each area, which equalled the survey sample size divided by the total target population, and the area-level post-stratification weights were multiplied by this fraction. Thus, the sum of these weights is equal to the sum of the combined sizes of the target population in each OSCE participating State as well as in Kosovo.

8.4. Sampling tolerances

As the data is based on a sample rather than the entire population, and the percentage results (or estimates) are subject to sampling tolerance, not all differences between results are statistically significant at the 95% confidence level. When calculating the confidence intervals, the effective sample size must be taken into consideration.

The effective sample size (or the design effect, a related concept) is linked to individual estimates, and so it will vary across estimates. To calculate the design effects for the total sample size in each OSCE participating State and overall, a formula based on the following ratio was used:

Design effect = (unweighted sample size) * (sum of the squared weights) / (square of the sum of weights)¹⁶

This approach to design effect estimation is related to disproportional sampling (in the case of the OSCE survey, the women in each household were selected with unequal probability, depending on the number of eligible women in the household), as well as unequal nonresponse across population segments, which were corrected with post-stratification weights (as described above).

The tables below summarize the design effect for the total sample size and conflict-affected sample size and provide confidence intervals based on the effective sample size for a survey estimate of 50%.

¹⁶ Leslie Kish, "Weighting for unequal Pi", *Journal of Official Statistics*, 8 (1992): 183–200.

Table 8.1. Effective sample sizes for the OSCE participating States surveyed – total sample

	N	Design effect	Effective sample size	95% confidence interval for a survey estimate of 50% based on a weighted sample
